Determination of Boiling Point

The boiling point is the temperature at which the vapor pressure of a liquid equals the external pressure surrounding the liquid.

Therefore, the boiling point of a liquid depends on atmospheric

Bookmark File PDF

pressure. The boiling point becomes lower as the external pressure is reduced.

Definition of Boiling Point in Chemistry

The boiling point of a substance is the temperature at which the vapor pressure of a liquid equals the pressure surrounding the liquid and the liquid

Bookmark File PDF

changes into a vapor..

The boiling point of a liquid varies depending upon the surrounding environmental pressure.

A liquid in a partial vacuum has a lower boiling point than when that liquid is at atmospheric pressure.

POINT DETERMINATION

The boiling point, like the melting point, is used to characterize a liquid substance and is particularly useful for identifying organic liquids. Many organic liquids, however, are flammable and this determination must be done with care.

Determination - chymist.com

Distillation is a simple and effective way to measure the volatility and boiling point of an organic compound within a small period of time. Separation and purification of liquids in a mixture can also be made possible using this process.
