of today's EDM power supply. The specific parameters that affect the surface integrity are voltage, amperage, on-time, and duty cycle. These parameters can be manipulated to optimize efficiencies in the roughing, semi-finishing, and finishing stages, and control the surface integrity accordingly. Since the EDM discharge produces the white layer

EDM Effect on Surface Integrity

The on-time is well known as having a direct effect on the surface finish of the cavity as longer on-times result in a rougher cavity finish than shorter on-times. Regardless of the voltage or amperage applied, it is the on-time portion of the

Sliding friction is typically lower in the direction of "lay" than across it. "Lay" also affects the long-term durability and performance of seals acting on the surface. With EDM there is no "lay" and EDM finish quality can be mirror-like. Erosion rather than cutting. EDM works by creating arcs of electricity between the tool and workpiece.

The aerospace industry discovered the EDM process damaged the surface of the components being machined. This damage was a result of the heat generated by the EDM process, and consisted of the recast layer, or white layer, and an annealed Heat Affected Zone (HAZ), which lay directly below the hard recast layer.

Electrical discharge machining (EDM), also known as spark machining, spark eroding, die sinking, wire burning or wire erosion, is a metal fabrication process whereby a desired shape is obtained by using electrical discharges (sparks). Material is removed from the work piece by a series of rapidly recurring current discharges between two electrodes,

This study focused on the material removal rate (MRR), the surface roughness, and tool wear in a 304 stainless steel EDM. The composite electrode consisted of copper (Cu) and silicon carbide (SiC). The current effects imposed on the working material, as well as the pulses that change over time during the experiment.

In order to reduce the thickness of recast layer and improve the surface quality of film cooling holes of nickel alloy, in this paper, the effects of four different types of dielectric fluids on surface integrity of the recast layer formed during high speed EDM drilling process were investigated; the formation mechanism of the recast layer on nickel alloy was discussed by comparing the surface characters of the bulk and those of

What is its effect on surface integrity? During EDM each individual spark vaporises, then melts, a small amount of material and leaves a crater in the work-piece. This is consistent in both wire or spark EDM applications.
