**INTRODUCTION** File sharing is the practice of distributing or providing access to digitally stored information, such as computer programs, multimedia (audio, images and video), documents, or electronic books. It may be implemented through a

Design and implementation of an online file sharing system

We have designed and implemented two

new filesystems that are included in the standard Linux kernel. These filesystems, called "Extended File System" (Ext fs) and "Second Extended File System" (Ext2 fs) raise the limitations and add new features. In this paper, we describe the history of Linux filesystems.

File system design is governed by two general forces: technology, which provides a set of basic building blocks, and workload, which determines a set of operations that must be carried out efficiently. This section

System design is the phase that bridges the gap between problem domain and the existing system in a manageable way. This

phase focuses on the solution domain, i.e.

“ how to implement? ” It is the phase where the SRS document is converted into a format that can be implemented and decides how the system will operate.

design and implementation. Operating System Design Goals It is quite complicated to define all the goals and specifications of the operating system while designing it. The design changes depending on the type of the operating system i.e if it is batch system, time shared system, single user system, multi user system, distributed system etc.
