In this paper we show that a robot manipulator with 6 degrees of

many publications in the field which have presented results in only theoretical terms. This book also includes "benchmark" results that can be used for the development of future work, or can serve as a basis for comparison with other work. In

The purpose of this monograph is to present computationally efficient algorithms for solving basic problems in robot manipulator dynamics. In particular, the following problems of rigid-link open-chain manipulator dynamics are considered : i)

Download Free Robot Manipulators Mathematics

computation of inverse dynamics, ii) computation of forward dynamics, and iii) generation of linearized dynamic models. Computationally efficient solutions of these problems are prerequisites for real time robot applications and simulations. Cartesian tensor

Download Free Robot Manipulators Mathematics

Analysis is the mathematical foundation on which the above mentioned computational algorithms are based. In particular, it is shown in this monograph that by exploiting the relationships between second order Cartesian tensors and their

Download Free Robot Manipulators Mathematics

vector invariants, a number of new tensor vector identities can be obtained. These identities enrich the theory of Cartesian tensors and allow us to manipulate complex Cartesian tensor equations effectively.

Moreover, based on these

Download Free Robot Manipulators Mathematics

identities the classical vector description for the Newton-Euler equations of rigid body motion are rewritten in an equivalent tensor formulation which is shown to have computational advantages over the classical vector formulation. Thus, based on

Download Free Robot Manipulators Mathematics

Cartesian tensor analysis, a conceptually simple, easy to implement and computationally efficient tensor methodology is presented in this monograph for studying classical rigid body dynamics. XII Application of this tensor methodology to the

Download Free Robot Manipulators Mathematics

dynamic analysis of rigid-link open-chain robot manipulators is simple and leads to an efficient formulation of the dynamic equations of motion.

The fifty-three contributions collected in this book present

from the United States, Japan, France, the United Kingdom, West Germany, and Australia. Chapters in the book's first part explore the connection between perception and action in three sections that deal with task level programming, integrated systems, and walking

machines. The second part reports recent progress on the perceptual basis of robotics, with chapters grouped in sections on visual inspection, three-dimensional vision, and (nonvisual) local sensing. The third part focuses on systems that

facilitate action, with sections that discuss mechanisms, kinematics and dynamics, and feedback control. A final part considers the application of robot systems to manufacturing, with chapters divided into two sections: on systems for
